This paper examines how product bundling affects a firm's markups at various levels in international trade. Joint pricing decisions for multi-product firms with product bundling entail information about joint markups in their profit maximization problem. Utilizing this information, I propose a method to estimate transaction-level markups incorporating multiproduct firms with product bundling. Focusing on Chinese exporters, multi-product firms that bundle products enjoy markups that are roughly 30% higher than firms with independent pricing. Analysis of China's WTO accession shows that although trade liberalization increased markups for bundling firms, tariff reductions reduced markup differences across all firms through greater competition.
